

Types of filter in Power BI :-

→ Three types

- (I) Filter on the visual
- (II) Filter on this page
- (III) Filter on all pages (Referred)

- Filter on the visual :- It will work when we select any visual.
- Filter on this page :- It work for whole page.
- Filter on all pages :- It works for all pages (back and forth).

New Card or Spark Card

- It fills the purpose of single and Multiple Card both.
- Under it, I can insert the images and gives the reference, label also which I can't do in single cards and multiview cards.
- I can compare two values in a single card with the help of reference label.

Example → Suppose If I insert a ~~new~~ new card and insert the sales, quantity, discount, Now I want to work on values action. I will go on callout, and inserting the image, I will go on image area.

Now, my Task is to compare the sales with Profit. So, in visual I go to reference labels. There in cards I select Sales, and I dragged. Profit in add label.

Now If I want to any editing in profit then I go to the reference labels layouts.

If I want that Profit values between minimum to 5 lakhs in red colour, 5 lakhs to 10 Lakhs in yellow colour and 10 lakhs to max in green colour. I have to do conditional formatting

go to reference label → Band (Sum of sales) →
values → Colour → Click on effects and in format style
"select the rules"

Q What field should be we based this on?
→ "sum of profit."

→ It provides the additional or Tooltip extra information for a particular point.

* Basic tooltip:-

→ It gives the extra info in the chart or the visual.

Example → Take a clustered bar chart with respect to category wise sales.

Now, click on the visual → Build visual →

At the bottom tooltip option at the is there →

Drag & Profit & discount in the tooltip.

Now, if I keep the cursor on any category then it will show the sales but with it also gives the information for profit and discount.

Steps → (i) clustered bar chart

(ii) Click on Visual

(iii) Build visual

(iv) Tooltip option

(v) Drag & Profit & discount

* Advanced tooltip:-

→ It also provide the additional information for a particular point but in the form of visual.

Example → Take a blank sheet, take a clustered bar-chart with respect to category wise profit.

* Click on the visualization pane → General setting type → tooltip.

* Take a new page, select clustered bar chart with respect to category wise sales → Visualization pane → General → Tooltip (All) → Page (Tooltip page)

→ Now, If I keep the cursor on any bar I will have the description with the visual.

Drill-Through

→ It gives more detailed analysis for a particular point, for another page.

Example → I have taken clustered bar chart (Total sales by category) on other page taken same chart (Total profit by category).

→ Now, in the profit page in the visualization pane in the drill through if I add category then If I go to sales page and right click over there, so Drill through option comes if I selected particular category it will show me the profit also in the other page.

What ever the page I go in any visual If I found the Category then Drill through option will also there we have to do right-click.
