

Gauge Chart:

- It looks like speedometer.
- It is used to identify that is our target achieve or not.
- * Suppose If I want to see that my each customer has purchased a particular amount of target sales or not. Then we can do it by Gauge Chart.

Steps → Insert the gauge Chart → Take the total sales in value.

Now we have to create the target for it.

- (i) go to data pane → Right click on anywhere →
New measure → Target → Value = 20,000

Now, this measure will appear in the data pane.

- (ii) Drag this target value in the target value option.
- (iii) Click the Gauge Chart → Visualization pane → Visual
→ Gauge Axis → Set the target there.
- (iv) Now insert the slicer → Take the customer name for it

Now, if I click any customer name I am able to find about the achievement of my target. (Achieved or not).

MAP

* Necessary Conditions to make it work:

- (I) It works with system is connected with Internet (There must be internet)
- (II) When we are sign out from PBI service, you must be logout.

Steps → In the files → options & settings → security →
Field & Map field Visual must be checked

- (III) Under the global → security → filled map visual must be ticked.

When the PBI service is logged in, that time map doesn't work because PBI services don't allow all the services at free of cost. In the companies we get the subscription of PBI services then it can work.

* If I drag country in location, in total sales in bubble size then, whenever the sales exist, it will come with bubble size and depends on sales value.

* Maps shows country wise sales in bubble form.

Filled Map

→ In it whenever the sales exist, it makes that area filled.

@ The difference between filled maps & maps is that the countries where we having the sales this country will not be painted with bubbles they will come completely with filled visual.

KPI Cards

"Key performance indicator"

It shows the target achievement.

If my target is achieved then, the values comes with the green line otherwise red exist.

- It shows actual (Current/Target value)
- It shows the trend also, Under it I have drag total sales in value.

Example → years in trend axis and KPI target. (No measure) in that target section.

Key Influencers

→ Suppose if the sales is High, then it will tell the reason to be high.

Example → It take sales in analysis, (Category, market and sum of discount) in explain by.

Then it tells the region that in which category in market discount value my sales are doing well.

Decomposition tree

→ In the Decomposition tree, If I take total sale in analysis and market, Country, region, in explain by.

So I can know in which country in which region in which market the Highest and Lowest sales is there.

→ The decomposition tree is an AI visual in PBI that helps you analyse one major by Breaking it down into different dimension by state.

Example → Total Sales → Region → category → Year

Q and A Visual

→ This let you ask question in normal language and instantly get visual as answers.

For example → Top 2 country wise sales.

Que → What is filter?

Ans → It keeps the selected one while it remove the remaining one.

Que → What is Highlight?

Ans → It keeps the all section visual but highlight the select one only.

→ In my visualization chart, Slicer Button slicer, text slicer, list slicer.

Suppose If I take Category wise sales, in Pie chart, In text slicer, Chart, I type F then pie chart show me the sales, for those Category which consist F in their Category.
