

Bridge table

→ It is also known as junction table or intermediate table or bridge table.

→ It is used in many to many relationships. The many to many relationship may cause the error that's why for converting $* - *$ into $* - 1$ or $1 - *$

(By it, the many to many becomes many-to-one or one-to-many)

* How to create this bridge table

→ In the power query editor with the help of append queries as a new we append both the sheets and then a fact of common column and remove the other column also remove the duplicate from the common column. Now just load it.

Now, the many to many is converted into $1 - *$ or $* - 1$.

Steps:-

Step-1 → Remove all relationship in Power BI modelling.

Step-2 → Find the common column in the two tables.

Example → Here, Country

Step-3 → Go to transform data → append both the tables using append-queries as new.

Step-4 → Now remove whole columns except country and apply remove duplicate from country.

Step-5 → Load all these sheets and then go to power BI modelling.

There we see that the bridge table has converted the relationship from many-to-many to one-to-many or many-to-one.

Now, if we do the analysis with the Country column which is in the bridge table, the whole analysis will be OK.

BRD (Business Requirements Documents)

⇒ Basically its a "Question" which is given by the company and under it all the necessity or needs provided by the company which all are to be implemented in the dashboard.

FRD (Functional Requirements Documents)

⇒ Its a answer for the Business requirements documents (BRD).

Suppose whatever the BRD is given by the company to the employee in that reply the employee provide the FRD.

Example ⇒ We have shared the BRD in the google classroom for that we creating the FRD and submitting in the google classroom.
