

Field Parameter

→ With the help of it, I can put multiple dimension in the x-axis

Example → Let's take clustered bar chart which is showing category-wise sales.

I want to see category-wise profit and quantity in that visual only for it I have to create field parameter.

Modelling → New Parameter → fields select the fields from table and create

Now drag the parameter in x-axis it will show me the slicer in report page.

So with the help of slicer, I can change my visual.

* Think to remember :-

→ If we want to put sales, profit and quantity in the x-axis with the help of field parameter before doing the process, we should create the measures of all three.

Total profit = sum of sheet 1

How to connect PBI with SQL

⇒ Home tab → Get data → My SQL database → Connect →
Server (local host: 3306) → Database (Name of the database
which we created in SQL) → OK

* For the 1st timer:

• It will ask for username also → Password → Connect →
Transform & load

* For the 1st timer select the database only not the windows.
