

Types of Data modelling relationships

- (I) On the basis of Cardinality
- (II) On basis of active vs Inactive
- (III) On basis of filter direction (Unidirectional and Bidirectional)

(1) On the basis of Cardinality:

- (I) One to one.
- (II) One to many.
- (III) Many to one.
- (IV) Many to Many.

(2) On basis of Active, inactive relationship :-

→ Suppose if there is a relationship existing between the two tables then, A dark bold line (—) between two table take place but if there are another option to create the relationship between two columns that this relationship are represented in the data modelling between the tables by dotted lines (----) we can make it active but we have to make already existing relation from active to inactive.

Steps:-

Just right click → On the bold line → Properties → Uncheck to make this relationship active.

(3) On basis of Unidirectional and Bidirectional / Cross filter:-

@ Unidirectional $\Rightarrow$ It means the filter is following at one side (usually dimension table to fact table). It is represented by single arrow ($\rightarrow$) sign.

@ Bidirectional $\Rightarrow$ Under it the filter follows in both direction.
or Cross filter Means DT to FT. { Dimension table to fact table }
and FT to DT. Its represented by both side arrow ($\leftrightarrow$) sign.

Example $\Rightarrow$ I am have 2 DT and 1 FT and my DT are connected by FT now if I take the tables and take one column of one table and another column of the another table in the another table and do it for 3rd also.

Now, take three slicer take one column of the 1st table from the 2nd table take any column in the 2nd slicer and do for 3rd also.

Here, we can check in case of unidirection which slicer affect which table and which condition.
