

Split column :

- A single column can be divided into multi-columns
- Split column is available in Home Tab.

Arithmetic Operations :

- The arithmetic operations can be performed with the help of transform or add column tab.
- Under it the standard is given, where we can do the operations

Group by :

- Suppose, If I want to see the countrywise profit from the financial data sheet then I use group by.
- It is available in the transform tab :
- In group by → Basic → Country → New column name (Country wise profit) → operation (Sum) → Column (profit).

* In P&E, just right click on any sheet name and we can create the duplicate from there.

Visualization :

Table Visual :-

- It is present in the form of rows and columns, ex: If I take categories, sub-category, sum of sales and sum of profit, then it show me in the form of Rows and column in the structured way, it is used for the detailed explanation.

• Matrix visual / Pivot table / Summarize table :-

→ It gives me the hierarchy.

Ex: Category to sub-category. It also consist of the drill down and drill up options by which, I can reach the lowest point of the data, with the grand total, it provides me the sub-class tables.

• What is dataset?

→ A raw data with the calculated columns, calculated measures, and the relationship between the tables is known as dataset.

Conditional formatting :-

→ In the table visual, If am to provide conditional formatting on sales column like Red to Green (Low to High) so goto

* visualization pan → values → sum of sales → sum of sales
→ Right click → CF → Background Colour →
format style (by gradient) → Low (Red) and High (Green).

→ If I have to create my own rules that (minimum to 1 lakh) Red colour. → 1 lakh to max green colour.

→ In format style instead of gradient I will choose (convert)

Rules → My data is in no form so I will convert into number form.

After creating min to 1 lakh, now I have to create 1 lakh to max → New rule.

How to use format painter in Power BI :-

→ If I have done conditional formatting in tables and I want to see it in matrix also (same as it is).

Steps → Select the table → Home tab → Format painter → Go to matrix visual → Double click over there.

Biggest difference between Table and matrix :-

→ In the matrix table we can achieve the lowest table of the data which is not possible under the table with the help of drill down option.

Single row card :

→ It is used to display the single KPI. Ex-sales, Profit.

Multi row cards :

→ It is used to display the multi KPIs.
Generally it is used for the summary of the datasets.

* How to format the values of single card ?

→ Select the card → Visualization pane → format → Visual → Callout values,

In the callout values even we can change the units also

Ex :- M to B

* Generally we preferred colours in any card is light theme.

How to add title in the card :-

⇒ Select the Card → Visualization pane → Format visual
→ General → Title.

* If I want to add the background colour in the card place of title, I will choose effects there in back ground, There we have to reduce the transparency to (0%).

Here we are having the visual border options from which I can make the border corner rounded.

* Here we are having the option of shadow also.

(The total value which is coming (12.64M) if in are callout value
→ Visual → Callout value → From here we can change the display unit also.

(The total value which is coming (12.64M) is in.
At the bottom sum of sales is coming it is at (

Steps ⇒ Select the visual → visual → category level

What is Canvas :

⇒ By default in my report page when I click on any visual, that times it comes on the specified area only which is Canvas.

How to Change Canvas Background :

Random click on Canvas → goto visualization pane →

Format your report page → Canvas background.

vivo Y20G 2021 the transparency (0%)

2026.03.18 22:00

- * I can change the overall colour by choosing wallpaper in the place of Canvas background.
- * The single card callout values are always **Bold & Bigger** (By default) as compare to multirow card.
